

Research Evidence for Data Mining

ELMAR Contribution by J. Scott Armstrong

March 24, 2003

Rather than examples of the usage of data mining, I am interested in studies that evaluate the ability of data mining to produce better forecasts or decisions than those provided by alternative procedures. I have asked many experts for such evidence, but have been unable to obtain any. My hypothesis is that data mining, much like stepwise regression, will prove useless. It's not about the computer. It's about theory.
